INL/MIS-25-84500

### Svetlana Lawrence RISA Pathway Lead

April 29, 2025

# **Risk-Informed Systems Analysis (RISA)**

LWRS Spring Program Review – Pathway Overview

# **Risk-Informed System Analysis (RISA)**

- Objective (the what)
  - R&D to optimize safety margins and minimize uncertainties to achieve economic efficiencies while maintaining high levels of safety
- Approach (the how)
  - Provide scientific basis to better represent safety margins and factors that contribute to cost and safety
  - Develop new technologies that reduce operating costs

### **Expanded RISA Objectives**

- Creating capabilities in advanced modeling and simulation
  - Advanced modeling and data analytics to inform condition-based equipment maintenance
- Improving plant capacity factor
  - Outage optimization project addresses the risk of outage overruns (\$1M-\$2M for each additional outage day)
- Mining for margin
  - More accurate modeling and simulation allow to reduce conservatism leading to larger safety margins
  - Larger margins enable important initiatives supporting sustainability, e.g., larger power uprates, longer refueling cycles

# **Power Uprates - Unprecedented Opportunity**

# Near-term delivery of substantial amount of reliable baseload energy. Untapped available power (historical level of uprates):

- BWRs: ~ 1,800 GWe, equivalent to ~ 2 large LWRs, or ~ 15-20 small modular reactors
- PWRs: ~3,600 GWe, equivalent to ~ 3-4 large LWRs, or ~ 30-40 small modular reactors

#### Near-term, cost-efficient added power from existing nuclear fleet

- Estimated costs of power uprates
  - Small uprates (MUR, < 2%): ~ \$500 \$800 / kW
  - Medium uprates (SPU, 2%-7%) ~ \$800 \$1,500kW
  - Extended power uprates (EPU, > 7%): ~ \$1,500 \$2,500 / kW
  - Very large power uprates with large plant modifications: up to \$5,000 / kW
    - Vogtle Units 3 &4: ~ \$11,000 /kW,
    - New AP1000 estimates: 8,300-10,375/kW, 6.5 8 years construction time<sup>1</sup>
- Improved economics of plant lifetime extension for another 20 years
- An opportunity to modernize

#### Bridging the gap to new nuclear

- U.S. nuclear energy to triple by 2050 need to start with uprates
- Re-establishing U.S. nuclear capabilities and dominance:
  - Workforce
  - Supply chain for nuclear-grade systems and components
  - Scaled capacity of regulatory framework

#### Added power to produce hydrogen

- Explicitly allowed for IRA's §45V hydrogen production credit
- Hydrogen credits further strengthen the business case for power uprates

# Larger Uprates Faster – the Urgent Need

#### Goals for the R&D:

- Enable larger-size uprates
- Demonstrate safety of power uprates
- Support economic feasibility by efficiency gains

S ENABI

# Objective of Power Uprate:

Increase generating capacity as much as possible while ensuring safety and economical feasibility CONSTRAINTS

# Larger Uprates Faster → SYSTEMS INTEGRATION

#### R&D AREAS:

- Enhanced modeling and simulation tools
  - Systems analyses
  - Fuel performance
    analyses
- Demonstration of adequate safety margins
  - Reducing
    conservatisms
  - Detailed analyses
  - Reducing uncertainties
- Artificial Intelligence and Machine learning (AI/ML) technologies
- Risk-informed licensing pathways
- Feasibility assessments
- Demonstrated case studies

### **Novel Approaches to Support Plant Activities**

### **Risk-Informed Compliance**

#### CHALLENGE

• Regulatory-required analyses of plant records are very labor-intensive with imprecise results due to human bias and errors.

#### RESEARCH

- Develop an approach for analysis of industry actions and events
- Develop AI-supported capability for automation of LAR preparation for large plant modifications (e.g., cycle extension, power uprate)

#### IMPACT

6

 Expedited and consistent process of reports preparation to support regulatory reviews → faster, cheaper LAR preparations and reviews

#### COLLABORATION

Over 70% of the fleet contributed data to MIRACLE database

#### DEPLOYMENT TIMELINE

- FY20-24 Methodology was developed and demonstrated with collaborators
- FY25 Application for automation of LARs
- FY26 Demonstrate LAR automation via a case study with collaborator

**MIRACLE** (*Machine Intelligence for Review and Analysis of Condition Logs and Entries*) is an artificial intelligence tool developed to automate condition report handling with natural language processing and machine learning.

# **Advanced Methodologies**

### Plant Reload Optimization

#### CHALLENGE

• Nuclear fuel is expensive ~ 20% of total O&M costs

#### RESEARCH

- Development of an automated integrated multi-physics approach to core design
- Methodology for multiple-objective optimization (e.g., minimize new fuel volume and increase safety margins)

#### IMPACTS

- Economic gains through reduction of volume of new and spent fuel and more efficient fuel use
- Enable larger power uprates
- Improve operational flexibility (fewer down power events)

#### COLLABORATION

Constellation Nuclear, planned Westinghouse

#### DEPLOYMENT TIMELINE

- PWR: already operational, fully-integrated integrated multi-physics approach end of FY26
- <sup>7</sup> BWR: ~ end of FY28

# **Novel Approaches to Support Plant Activities**

### Automated knowledge extraction from plant records to optimize maintenance

#### CHALLENGE

• Expensive operations and maintenance (O&M) of plant systems and highlyconsequential equipment failures require advanced diagnostic and prognostic techniques to reduce O&M costs and preclude unexpected failures.

#### RESEARCH

- Create an Artificial Systems Engineer enabled reasoning not just data processing
- Automate knowledge extraction from numerical and textual data for integrated knowledge base that mimics the process of human knowledge collection, retention, and use

#### IMPACTS

- Ability to detect failures before they occur  $\rightarrow$  cost savings and safety improvements
- · Knowledge retention and transfer to expedite workforce training and improve retention

#### COLLABORATION

Ontario Power Generation, PSEG

#### DEPLOYMENT TIMELINE

- FY24 Initial methodology was developed and demonstrated with collaborators
- FY25 Refinement of methodology and development of tool DACKAR 1.0 (Digital Analytics, Causal Knowledge Acquisition and Reasoning for Technical Language Processing) <u>https://github.com/idaholab/DACKAR</u>
- FY26 DACKAR 2.0 deployment with added features if automatic problem identification and explanation using Large Language Model Artificial Intelligence (LLM AI)

Connecting data to decisions

# **Novel Approaches to Support Plant Activities**

### **Optimization of Plant Outage Activities**

#### CHALLENGE

• Outages are consistently longer than scheduled causing lower capacity factors and profit loss (a day of plant not-operating costs ~ \$1M-\$2M).

### RESEARCH

- Develop tools and methods to optimize plant outage activities
- Improve outage planning and execution

#### IMPACTS

- Minimize unforeseen outage duration overruns
- Optimize utilization of resources during outages

### COLLABORATION

Ontario Power Generation

#### DEPLOYMENT TIMELINE

- FY24 Methodology was developed and demonstrated with collaborators
- FY25 Methodology improvements and development of a tool supporting outage performance, to be released at the end of FY
- FY26 Small addition of the capability of resource management in addition to the traditional schedule management

Example of Outage Progress Monitoring

# **Advanced Methodologies**

### **Digital I&C Risk Assessment**

#### CHALLENGE

 Urgent need for an efficient and quantified approach to risk assessment of digital I&C systems to support control room upgrades

#### RESEARCH

- Provide an objective, systematic, verifiable and reproducible approach for risk assessment of DI&C systems
- An integrated platform that addresses the risk triplets in DI&C systems: what can go wrong, how likely is it, what are the consequences

#### IMPACTS

- Support of DI&C systems regulatory approvals
- Elimination of the need for redundant systems

#### COLLABORATION

 Pressurized Water Reactor Owners Group (PWROG), Westinghouse, GE Hitachi, Framatome

#### DEPLOYMENT TIMELINE

- Methodology developed and demonstrated with collaborators
- FY25 methodology and tool refinements
- FY26 develop a software tool to support user-friendly, efficient process of risk assessments of digital I&C systems

## **Advanced Modeling and Simulation**

### **Virtual Assessments of Human Actions**

#### CHALLENGE

• Digitalization of plant operations require assessment of human actions under the new operating conditions.

#### RESEARCH

Demonstrate human performance with an upgraded digital system in the control room

#### IMPACT

• Expedite regulatory approvals of digital upgrades of safety-related systems

#### COLLABORATION

 Utilities (Duke Energy, Southern, APS, Constellation) and vendors (Westinghouse, Curtiss-Wright)

#### DEPLOYMENT TIMELINE

- FY25 Couple HUNTER to full-scope plant simulator in the Human Systems Simulation Laboratory (HSSL) at the Idaho National Laboratory
- FY26 Evaluation of virtual operator performance of existing plant against upgraded plant to identify changes in important human actions
- FY27 Development of software tools for consistent approach to evaluate human performance in digital environment or for novel applications (e.g., collocated hydrogen generation)

#### Human Activities | Performance

HUNTER Conceptual Framework HUNTER: Human Unimodel for Nuclear Technology to Enhance Reliability
